

Clinical Data

blue[®]m oxygen technology

Protection for natural teeth and implants. Accelerating wound healing, implant integration and bone regeneration in a safe, effective and non-invasive approach.

- Works instantaneously
- Effective on all micro organisms
- No resistance developed
- No side effects
- No toxic ingredients
- Simple concept

Wound healing

Wound healing requires a variety of cells to increase their metabolic activity, resulting in a high oxygen demand.¹ Oxygen at the wound site has been shown to promote wound healing by stimulating several processes, including;

- Neovascularization²
- Collagen production^{3,4,5}
- Phagocytosis (engulfing of microorganisms, cells, or debris by macrophages or neutrophils)^{6,7}
- Neutrophil-mediated oxidative microbial killing⁷
- Degradation of necrotic wound tissue⁸

Lack of sufficient oxygen (hypoxia) has been associated with pain in the wound area, with the prevalence of hypoxia being more pronounced in patients who are smokers and diabetics. These populations demonstrate slower wound healing and increased risk of wound healing complications compared to healthy patients.^{9,10,11}

blue[®]m mechanism of action

blue[®]m is using a mechanism to deliver active oxygen (H₂O₂) in a controlled manner directly to the treatment site. In contact with saline Sodium perborate is converted into sodium borate and H₂O₂. In low concentrations of 0.003%- 0.015%, hydrogen peroxide has a disinfectant⁸ action, and occurs, together with the antibacterial ROS (reactive oxygen species) during the respiratory burst of neutrophils in normal wound fluid^{12,13} and has a chemotactic effect on leucocytes¹⁴ The concentrations of hydrogen peroxide in the blue[®]m products used are not comparable to the high concentrations (1.5 – 3%) of hydrogen peroxide used in medicine as a disinfectant. It is known that the production of free radicals then causes damage to the wound.^{19,15} Research has shown that the continuous presence of a low concentration of hydrogen peroxide kills pathogenic bacteria much more effectively than a one-off high concentration¹⁶ and that fibroblasts are not damaged by this.¹⁷.

Function of the blue[®]m ingredients:

- **Accelerated tissue remodeling: Sodium Perborate²¹ & Honey²²**

Application of blue[®]m (oral gel) to injured tissues accelerates wound healing. Tissue oxygenation at peri-implantitis sites was significantly decreased ($p < 0.05$) when compared with that at healthy sites.²⁰.

- **Plaque control: Sodium Perborate^{23,24} Honey²⁵ and Xylitol^{27,28}**

Oxygen molecules (O^2) can penetrate much deeper into the biofilm to kill the anaerobic bacteria than the Chlorhexidine ($C_{22}H_{30}Cl_2N_{10}$) molecule.

Oxygen molecule (O^2) can penetrate much deeper into the perimucosal seal around

the implant.

- **Bone growth accelerator: Lactoferrin^{29,30}.**

Lactoferrin potently stimulates the proliferation and differentiation of primary osteoblasts.

Relative Dentin Abrasion (RDA <30)³⁵:

blue[®]m toothpaste has a neutral pH value and contains no scouring ingredients. Therefore no damage can be caused to the surfaces of teeth or implants.

Fluoride:

Most blue[®]m products are Fluoride-free. Fluoride impairs the corrosion^{31,32,33,34} resistance of the titanium implants. Due to the corrosion microscopic particles of titanium can be found in the surrounding tissue, which may have a negative impact on the devices, as this can potentially be pro-inflammatory.

Treatment indications

- Acute wound healing after implant placement
- Gingivitis³⁷
- Periodontitis³⁶
- Peri-implant mucositis
- Peri-implantitis³⁶
- Pericoronitis
- Oral Ulcers
- Pemphigus Vulgaris³⁹

Different concentrations of slow oxygen release

- blue[®]m toothpaste 75 ml +/- 20 mg / l O₂
- blue[®]m mouthwash 500 ml +/- 20 mg / l O₂
- blue[®]m oral spray 15 ml +/- 20 mg / l O₂
- blue[®]m oral gel 15 ml > 100 mg / l O₂
- blue[®]m oral foam 100 ml +/- 20 mg / l O₂
- blue[®]m oxygen fluid 500 ml +/- 40 mg / l O₂
